## Repository Information

Repository's URL: <https://github.com/pranay2503/waph-pranay2503>

This is a private repository for Sai Pranay Gundu to store all the code from the course. The organization of this repository is as follows.

### Labs

Hands-on exercises in Lectures

- Lab 0: Development Environment Setup
- Lab 1: Foundations of the Web

- Lab 2: Front-end Web Development
- Lab 3: Secure Web Application Development in PHP/MySQL
- Lab 4: A Secure Login System with Session Authentication

### Hackathons

- Hackathon 1: Cross-site Scripting Attacks and Defenses
- Hackathon 2: SQL Injection Attacks
- Hackathon 3: Session Hijacking Attacks and Defenses

### Individual Projects

- Individual Project 1: Front-end Web Development with a Professional Profile Website and API Integration on github.io cloud service
- Individual Project 2: Secure Full-stack Web Application Development

## Report

### The Project's overview

This project involved building a secure full-stack web application using PHP and MySQL, focusing on user authentication, profile management, and password updates. Key features included a registration system, secure login with session handling, profile editing, and CSRF protection. The UI was built using HTML, CSS, and JavaScript, with a focus on responsive and user-friendly design. The application enforced strong password policies, used hashed passwords, and implemented both client-side and server-side input validation to defend against XSS and SQL injection attacks. Through this project, I developed practical skills in secure coding, form validation, and session-based user management.

Project's URL: Individual Project 2

### Part 1 - Functional Requirements

**Task 1.A: User Registration** For the user registration component, I created a registration form where users could enter their username, password, full name, and email. Client-side validations were implemented using HTML5 attributes and regex patterns to ensure valid inputs. On the server side, all inputs were sanitized using `htmlspecialchars()` and trimmed before being processed. Passwords were hashed using `md5()` before storing them in the database. Duplicate usernames were checked in advance to avoid conflicts, and prepared statements were used throughout to defend against SQL injection.

**A Simple login form, WAPH**

**Task 1.B: Login** The login system used session management to authenticate users. Once credentials were validated using hashed passwords, PHP sessions were initialized and stored essential session variables such as username and user agent to help detect hijacking attempts. If authentication failed, users received an alert and were redirected to the login page to retry.

**Task 1.C: Profile Management** The profile management page allowed users to view and update their name, email, and username. The form fields were pre-filled with existing values pulled from the database, and changes were only saved if new input differed from the current data. I ensured that all user input was sanitized and updates were executed via prepared statements. Additionally,

CSRF protection was enforced using anti-CSRF tokens, which were generated at session start and verified during submission.

**Task 1.D: Password Update** The password update feature allowed authenticated users to change their password securely. Input was validated on the client side to enforce strong password criteria and sanitized on the server side. Passwords were stored using md5() hashing, and only non-empty values were accepted. A success or failure message was displayed based on whether the password was successfully updated in the database.

## Task 2: Security and Non-technical Requirements

**Task 2.A: Security** For security implementation, I ensured that no MySQL root accounts were used in the code. All database interactions were handled via prepared statements. Session management was handled securely by starting sessions on each authenticated page and destroying them upon logout to prevent fixation or hijacking.

```

1 <!DOCTYPE html>
2 <html lang="en">
3 <head>
4 <meta charset="utf-8" />
5 <title>WAP - Registration Page</title>
6
7 <style>
8   root { color-scheme: light; }
9   body {
10     margin: 0;
11     padding: 0;
12     font-family: "Segoe UI", system-ui, -apple-system, sans-serif;
13     background: #f0f2f5;
14     display: flex;
15     justify-content: center;
16     align-items: center;
17     min-height: 100vh;
18   }
19   .container {
20     background: #fff;
21     padding: 40px 30px;
22     border-radius: 12px;
23     width: 420px;
24     box-shadow: 0 4px 15px rgba(0,0,0,.1);
25   }
26   h2 {
27     text-align: center;
28     color: #333;
29     margin: 0 0 10px;
30   }
31   #digit-clock {
32     text-align: center;
33     margin: 6px 0 14px;
34     font-weight: 600;
35     color: #666;
36   }
37   form { display: flex; flex-direction: column; gap: 10px; }
38   label { font-weight: 600; color: #444; }
39   input {
40     padding: 10px;
41     border: 1px solid #ddd;
42     border-radius: 8px;
43     font-size: 14px;
44     outline: none;

```

**Task 2.B: Input Validation** Input validation was thoroughly applied on both the front-end and back-end. HTML5 validation patterns were used in the registration and password forms, while all user input was sanitized using a dedicated `sanitize_input()` function to mitigate XSS attacks and enforce consistent input hygiene. The database schema included a user table with columns for username, fullname, email, and hashed password, all of which were stored securely.

```

1 <?php
2 // changepasswordform.php
3 session_start();
4 if (!isset($_SESSION['username'])) { header("Location: login.php"); exit; }
5 $me = $_SESSION['username'];
6
7 function csrf_logout_alert() {
8   // Kill session first
9   $_SESSION = [];
10   if (ini_get('session.use_cookies')) {
11     $p = session_get_cookie_params();
12     setcookie(session_name(), '', time()-42000, $p['path'], $p['domain'], $p['secure'], $p['httponly']);
13   }
14   session_destroy();
15 }
16
17 <!doctype html>
18 <html lang="en">
19 <head>
20 <meta charset="utf-8" />
21 <title>Security Alert</title>
22 <meta http-equiv="refresh" content="2; url=login.php">
23 <style>
24   body{margin:0;padding:0;background:#ffe5e5;display:flex;justify-content:center;align-items:center;height:100vh;font-family:"Segoe UI",sans-serif}
25   .card{background:#fff;border-radius:12px;box-shadow:0 4px 15px rgba(0,0,0,.1);padding:20px 34px;text-align:center}
26   h1{margin:0 8px;color:#666}
27   p{margin:0;color:#333}
28 </style>
29 <script>
30   alert("CSRF Attack Detected!");
31   setTimeout(()=>alert("Logged out for security"), 400);
32 </script>
33 </head>
34 <div class="card">
35   <h1>CSRF Attack Detected!</h1>
36   <p>Logging out for security...</p>
37 </div>
38 </body>
39 </html>
40 <?php
41 <exit>
42
43
44 // If someone tries to pass a password in the URL... treat as CSRF

```

**Task 2.C: Database Design** I tested the application for XSS by injecting a JavaScript snippet into a form input. Since the application did not sanitize the output before reflecting it back onto the page, the script was executed and displayed an alert box containing the session cookie. This demonstrated a stored/reflected XSS vulnerability.

**Task 2.D: Front-end Development** The front-end was designed to be clean and responsive using internal CSS. Each page, including registration, login, profile, and change password—maintained a consistent visual style and responsive layout, ensuring usability across devices.

**Task 2.E: Session Management** Session management was enforced across all secure pages by checking for active user sessions and redirecting unauthorized users to the login page. Upon logout, session variables were cleared and the session was destroyed.

**Task 2.F: CSRF Protection** For CSRF protection, anti-CSRF tokens were used on all forms that modified data—such as updating profile information—ensuring that only legitimate user actions could trigger sensitive operations. If a CSRF attack is performed, it will have a dropdown box saying “CSRF attack detected” and automatically redirects the page to the login page after 5 seconds.
